

Counting chambers

Counting chambers are instruments for precise measuring. They are made of special optical glass and serve to determine the number of particles in liquids. Our counting chambers are manufactured in accordance with the DIN 12 847 and the German Calibration Ordinance.

In-vitro diagnostic applications generally require duplicate determinations. Consequently, our counting chambers for investigations of cell suspensions are equipped with 2 sets of grids. These counting grids are engraved into 2 ground and polished surfaces on the central ridge (=chamber bottom). This central ridge is located between 2 elevated also ground and polished ridges. A cover glass with a thickness of 0.4 mm is placed on top of these 2 outer ridges. This cover glass limits the examined volumes above the counting grids.

Dark-lined: standard counting chambers have counting grids which are engraved into the chamber bottom. Under the microscope the counting grid appears as a grid of dark lines.

Bright-lined: these counting chambers have counting grids which are engraved into an annealed metal coating, so that the counting grid appears as a grid of bright lines.

- [Drawings of the counting grids can be found here](#)
- [Find here an information about working with counting chambers](#)

Counting chambers, glass, DIN 12 847, with double net ruling, in transparent plastic box with 2 cover glasses 0.4 mm thickness, without clamps. The tolerance of the depth of chamber is $\pm 2 \%$

suitable for in-vitro diagnostic applications, CE
